NOVATECH

Company Overview

A fictional knowledge base for document ingestion and retrieval

Edition 1.0 | Training document

This company, its products, locations, people and figures are fictional. The document is designed for classroom use and does not describe a real organization.

1. Introduction

NovaTech is a fictional software company that helps organizations organize internal information, coordinate service requests, and understand operational performance. Its products combine searchable knowledge, workflow tracking, and reporting in one workspace. NovaTech sells to mid-sized organizations in education, logistics, professional services, and public-facing support.

The company was founded in 2018 by a small team of software engineers and operations specialists. In this training scenario it has 420 employees and serves approximately 650 customer organizations. These figures describe this edition of the fictional profile and are not live metrics.

Mission and operating model

NovaTech’s mission is to make useful information easier to find and routine work easier to coordinate. Product teams develop shared software, while customer-facing teams help clients configure it for their own processes. The company does not replace a customer’s internal policy owner: the customer remains responsible for the accuracy and approval of its documents.

What makes the business distinctive

The company combines a subscription software platform with onboarding and support services. A customer can buy the platform alone, but complex integrations and extensive migration work require a separate statement of work. This distinction helps students practice finding conditions and exceptions, not just single values.

2. Products and services

NovaTech offers three fictional products under the NovaSuite name. Customers may subscribe to one product or a combination. Each product has its own administrator settings, while user identity and audit logs are shared across the suite.

Product	Primary use	Typical user
NovaKnowledge	Organize documents and search approved knowledge.	Knowledge manager
NovaFlow	Track requests, ownership and workflow stages.	Operations coordinator
NovaInsights	Create dashboards from approved operational data.	Department analyst

NovaKnowledge

NovaKnowledge stores document records and makes approved content searchable. A document owner uploads a file, adds a title and category, and requests publication. Search results show the document title, its owner, and the last approved revision. The owner must review proposed changes before the new revision appears to ordinary users.

NovaFlow

NovaFlow organizes requests into queues. A request has a status, a named owner, and a due date when applicable. The product supports configurable steps such as submitted, in review, completed, and returned for clarification. Administrators decide which transitions are available to each team.

NovaInsights

NovaInsights provides dashboards and scheduled reports based on data that a customer has approved for reporting. It does not automatically import every source in an organization. A customer administrator selects the sources, and the analytics team validates data mappings during onboarding.

3. Customers and delivery

Who uses NovaSuite

NovaTech works with organizations that manage recurring requests and maintain shared knowledge. An education provider might publish student-service instructions, while a logistics company might track facility requests and consult equipment procedures. A customer organization controls its own users and content.

Typical delivery journey

A new customer starts with discovery, where the Customer Success team identifies its goals and assigns an onboarding lead. The implementation team then configures the agreed workspace, imports a sample of approved documents, and tests user access. A customer representative reviews the results before wider rollout.

After launch, Customer Support handles product issues through the support portal. Customer Success reviews adoption and coordinates improvement plans. Product Engineering prioritizes changes through its normal planning process; a support request does not by itself guarantee that a new feature will be developed.

Commercial boundaries

A standard subscription includes access to the licensed products and ordinary support. Custom connectors, historical data cleanup, and bespoke training are scoped separately. The account owner documents agreed deliverables and assumptions before any additional project begins.

4. Organization and leadership

NovaTech is organized into six departments. Each department owns a set of responsibilities, but work commonly crosses departmental boundaries. Department leaders report to the executive team and review progress at a monthly operations meeting.

Department	Primary responsibility
Product and Design	Product direction, research and experience design
Engineering and Data	Software delivery, infrastructure and analytics
Customer Success and Support	Onboarding, adoption and incident support
Sales and Partnerships	Commercial relationships and partner coordination
People and Operations	Recruitment, workplace and internal operations
Finance and Legal	Financial planning, contracts and governance

Decision ownership

The Product and Design department owns the product roadmap. Engineering and Data owns technical implementation and production reliability. Customer Success owns the onboarding plan, while Support owns customer-facing incident coordination. Finance and Legal reviews contractual and financial commitments.

Escalation

When ownership is unclear, the requesting team names one temporary coordinator and asks the relevant department leads to agree on an owner. The coordinator records the decision and next review date. This process prevents a request from being closed simply because several teams are involved.

5. Product, engineering and data

Product and Design

Product managers collect customer needs, define outcomes, and maintain the roadmap. Researchers interview users and test prototypes. Designers create interaction flows and interface guidelines. Product decisions consider customer value, accessibility, technical feasibility, and available capacity.

The department reviews proposed roadmap changes every six weeks. An urgent customer incident may trigger a separate review, but a proposal enters the roadmap only after a product owner records its scope and priority. Design research findings inform decisions and are not a promise that every requested feature will be built.

Engineering and Data

Engineering builds and maintains the software. Its application teams own features, while the platform team maintains deployment systems and shared infrastructure. The data team maintains reporting pipelines and helps validate the datasets used by NovaInsights.

For a typical release, an engineer proposes a change, another team member reviews it, and automated checks run before deployment. The owner monitors the release and records any operational issues. When a change affects customer data access, the team includes a permissions review in its release checklist.

Working together

A product manager describes the customer problem, a designer tests a proposed flow, and engineers estimate and implement the solution. Customer Support provides recurring issue patterns. The teams agree on success measures before release and review results after customers have had time to use the feature.

6. Customer-facing departments

Customer Success and Support

Customer Success helps customers launch and adopt NovaSuite. Each new account receives an onboarding lead who coordinates the initial plan and customer contacts. Support handles requests about product behavior, access problems, and incidents through a shared ticket queue.

Support records the affected product, business impact, and a contact for follow-up. The team prioritizes incidents according to severity and available evidence. If engineering help is needed, Support remains responsible for coordinating customer updates while Engineering investigates the technical issue.

Sales and Partnerships

Sales helps prospective customers understand the available products, subscription options, and implementation scope. Account managers maintain commercial relationships after purchase. The Partnerships team works with approved service providers and integration partners.

Sales does not approve technical delivery dates independently. Before a custom integration is promised, the account team consults Engineering and the implementation lead. Any delivery assumptions are recorded in the commercial proposal.

Example: a customer request

A customer asks for an integration between NovaFlow and an existing ticket system. Sales records the business goal, Engineering evaluates feasibility, and Finance and Legal reviews the commercial terms. Customer Success then coordinates the agreed onboarding work. Each team contributes, but the account owner is responsible for keeping the customer informed about the proposal.

7. People, operations, finance and legal

People and Operations

People and Operations supports recruitment, employee onboarding, workplace services, and internal processes. The workplace team coordinates shared office resources, while the people team maintains employee records and learning programs. Department managers remain responsible for defining role-specific training needs.

Finance and Legal

Finance manages budgets, financial reporting, purchasing controls, and billing operations. Legal reviews contracts and supports governance questions. A department may propose a purchase, but its approval depends on the applicable budget and purchasing process.

Information governance

Document owners are responsible for reviewing their own content. The central operations team maintains the document catalog and reminds owners when a review is due. Legal reviews documents that contain contractual terms; it does not independently approve all operational documents.

Example: a new supplier

A department identifies a supplier and explains the business need. Finance checks the budget, Legal reviews the contract, and the requesting department confirms the service requirements. After approval, the purchasing coordinator records the supplier and the relevant owner in the internal system.

8. Offices and locations

NovaTech operates from four fictional offices. Teams collaborate across locations, and an office's specialty does not mean every employee there belongs to the same department.

Office	Location	Main focus
Casablanca Hub	Casablanca, Morocco	Engineering, product and customer support
Rabat Office	Rabat, Morocco	Customer success and operations
Paris Office	Paris, France	Sales, partnerships and customer workshops
Montreal Office	Montreal, Canada	Data, research and regional customer support

Casablanca Hub

The Casablanca Hub is the largest office and hosts engineering planning sessions, product reviews, and support coordination. It includes a small demonstration area where customer teams can review sample workflows. Product and support employees in other offices participate in the same shared planning process.

Rabat Office

The Rabat Office focuses on customer onboarding, operations, and training coordination. The onboarding team works with customers in several regions rather than serving only local customers. Workspace support is coordinated with People and Operations.

Paris and Montreal

The Paris Office supports commercial discussions, partner relationships, and workshops. The Montreal Office focuses on data and research activities as well as regional support. Cross-office projects use a single documented owner, regardless of the office where the project was initiated.

9. How work moves across NovaTech

A product improvement

1. Support identifies a repeated issue and summarizes the evidence. 2. Product reviews the customer impact and decides whether to investigate. 3. Design and Engineering explore options. 4. The product owner prioritizes an agreed change. 5. Engineering delivers and monitors the release. 6. Support and Customer Success communicate relevant changes to customers.

A customer onboarding

1. Sales records the contracted scope. 2. Customer Success assigns an onboarding lead. 3. The customer identifies a document owner and administrator. 4. Implementation staff configure a test workspace. 5. The customer reviews the sample content and access. 6. The teams agree on a launch date and support handover.

A document update

A content owner proposes the change and checks its accuracy. If the content includes contractual language, Legal reviews that language. After approval, the owner publishes the revision and records the effective date. The previous revision is retained according to the customer’s configured retention rules.

Important distinction

A document being uploaded is not the same as a document being approved. In NovaKnowledge, a revision becomes available to ordinary users only after the responsible owner approves publication.

10. Quick reference and glossary

Question	Answer
Who owns the product roadmap?	Product and Design.
Who coordinates a new customer onboarding plan?	Customer Success assigns an onboarding lead.
Which office focuses on sales and partnerships?	The Paris Office.
Which product tracks requests?	NovaFlow.
Who reviews contractual terms?	Finance and Legal, with Legal reviewing contracts.
Does an uploaded revision appear immediately to ordinary users?	No. The document owner must approve publication.

Glossary

Customer administrator: a person authorized by the customer to manage its workspace and users. **Document owner:** the person responsible for reviewing and approving a document. **Onboarding lead:** the Customer Success contact coordinating the customer launch. **Roadmap:** a prioritized view of planned product work. **Statement of work:** a document describing agreed project deliverables and assumptions.

End of fictional training document. Figures, processes, and product names are invented for educational use.
